

Counters game

Today I would like you to make 10 double-sided counters with a different colour on each side. You could play this game with a grown-up. Carefully throw your counters up in the air and see what happens when they land. How many landed of each colour? Can you count them? Now get your grown-up to do the same. What happened when their counters landed on the ground? Did they get the same answers? Can you get 5 of each colour? Can you get 10 of all one colour? Have a few goes at trying this and maybe you could write out what happens each time for me to see.
